— HOW TO USE THIS GUIDE —

Your Food, Decoded

A quick-reference companion to your Food Preferences form.

This guide lists every item from your Evolved & Balanced Food Preferences form, organised into the same categories. For each food you'll find its calories, a full macronutrient breakdown, and a highlighted benefit — so you can build meals you enjoy while understanding exactly what fuels your body.

Every food is laid out exactly like this:

ITEM	CAL raw	CAL cooked	PROT g	CARB g	FAT g	KEY BENEFIT
Chicken breast	110	165	31	0	3.6	Lean, high-protein staple.
Apple	52	—	0.3	14	0.2	Fibre and vitamin C.

HOW TO READ THE TABLES

Basis — every value is per 100 g of the edible portion (beverages per 100 ml).

CAL raw — calories in 100 g of the raw or as-is food.

CAL cooked — calories once cooked, highlighted in gold where it applies. A dash (—) means a cooked value isn't relevant (fruit, cheese, oils, baked goods) — use the raw figure.

PROT · CARB · FAT — grams per 100 g, colour-coded for quick scanning, on the cooked basis when a cooked calorie is listed, otherwise raw / as-is.

Good to know — cooking removes water and concentrates food, so 100 g cooked often carries more calories and protein than 100 g raw. Weigh consistently — ideally cooked — when tracking.

SOURCES & ACCURACY

Values are based on **USDA FoodData Central** (the primary reference), cross-checked against **VeryWellFit** and **Yazio**. They are representative averages — real foods vary by variety, cut, ripeness and preparation, and any added oil, sugar or sauce shifts the numbers. Treat these as reliable planning figures, not lab-exact readings.

This is educational reference material, not individualised medical or dietary advice. Your personalised plan always takes priority.

Reading a Nutrition Label

Seven things to check on any packaged food — in order.

1

4 servings per container

2

Serving size

1 1/2 cup (208g)

3

Amount per serving

Calories

240

4

% Daily Value*

5

Total Fat 4g

5%

6

Saturated Fat 1.5g

8%

7

Trans Fat 0g

8

Cholesterol 5mg

2%

9

Sodium 430mg

19%

10

Total Carbohydrate 46g

17%

11

Dietary Fiber 7g

25%

12

Total Sugars 4g

13

35%

18

Potassium 240mg

6%

19

* The % Daily Value (DV) tells you how much a nutrient in a serving contributes to a daily diet. 2,000 calories a day is used for general nutrition advice.

1

Servings per container
 How many servings the whole pack holds — every number below is for ONE serving.

2

Serving size
 The reference amount. If you eat double, double every value.

3

Calories
 Energy per serving. Multiply by servings eaten for your true intake.

4

Quick guide to %DV
 5% or less is LOW; 20% or more is HIGH for that nutrient.

5

Limit these
 Saturated fat, sodium and added sugars — keep these on the lower side.

6

Get enough
 Fibre, vitamin D, calcium, iron and potassium — aim higher here.

7

Footnote
 %DV is based on a 2,000-calorie day; your targets may differ.

One more habit — scan the ingredients list. It is ordered by weight, so the first three items tell you what the food mostly is. Shorter lists with names you recognise usually win, and the **per-100 g** column lets you compare two products fairly regardless of pack size.

— PLAN YOUR INTAKE —

Calculate Your Calories & Macros

Four simple steps — follow the worked example in gold as you go.

1 ESTIMATE YOUR BASELINE (BMR)

Your Basal Metabolic Rate is what you burn at rest. Plug your numbers into Mifflin–St Jeor:

MEN	$BMR = 10 \times kg + 6.25 \times cm - 5 \times age + 5$
WOMEN	$BMR = 10 \times kg + 6.25 \times cm - 5 \times age - 161$

 Example — male, 80 kg, 180 cm, 30 yrs → **BMR ≈ 1,780 kcal**

2 MULTIPLY BY YOUR ACTIVITY (TDEE)

Pick the level that matches a typical week — this gives your maintenance calories.

SEDENTARY ×1.2 desk job	LIGHT ×1.375 1–3 d/wk	MODERATE ×1.55 3–5 d/wk	ACTIVE ×1.725 6–7 d/wk	ATHLETE ×1.9 2×/day
--	--	--	---	--

 Example — moderately active → $1,780 \times 1.55 = \sim 2,760 \text{ kcal / day}$

3 ADJUST FOR YOUR GOAL

Shift up or down from maintenance depending on what you want to achieve.

FAT LOSS –15 to –20% below maintenance	MAINTAIN hold at TDEE recomp / health	MUSCLE GAIN +10 to +15% above maintenance
---	--	--

 Example — fat loss at –20% → $2,760 \times 0.8 = \sim 2,200 \text{ kcal target}$

4 SPLIT INTO MACROS

 Set **protein** first (1.6–2.2 g/kg), then **fat** (0.8–1.0 g/kg); **carbs** fill the calories that remain.

EXAMPLE DAILY SPLIT

2,200 KCAL TARGET

PROTEIN 160 g 640 kcal · 29%	CARBS 233 g 930 kcal · 42%	FAT 70 g 630 kcal · 29%
---	---	--

Starting points only — track for two weeks, then nudge by about 10% based on real results.

— MAKE IT STICK —

Practical Daily Tips

Simple habits that turn the numbers into results.

1
Build the plate

Half vegetables, a quarter protein, a quarter smart carbs, plus a thumb of healthy fat — balanced without counting.

2
Protein first

Hit your daily protein target before anything else; a palm-sized portion at each meal makes it effortless.

3
Prep once, eat twice

Batch-cook proteins and grains so the good choice is always the easy choice.

4
Weigh consistently

When tracking, weigh food the same way every time — ideally cooked; otherwise estimate with your hands.

5
Hydrate

Aim for ~30–35 ml of water per kg of bodyweight; a glass before each meal also curbs over-eating.

6
Don't drink calories

Keep juices and soft drinks occasional — water, tea and coffee are essentially free.

7
Plan the treat

A portioned treat you scheduled beats an unplanned binge every single time.

8
Consistent beats perfect

Being 80% on-plan across a month outperforms being 100% for just three days.

The golden rule: the science is handled — you just bring the consistency. Cross-reference these habits with your personalised macros.
